Report on the Thesis submitted by Michael
J. Mulkey in partial fulfilment of the
requirements for the degree of Master of Arts

We have examined the thesis entitled "The Recruitment
of Scientists: A Case Study in Canada" submitted by Michael J.
Mulkey for the degree of Master of Arts of Simon Fraser University.

The thesis comprises two parts. The first is a general survey of the studies which have been made, principally in North America, of the recruitment of natural scientists, in relation to the growth of science in the universities, government and industry. In this part the candidate has also set out and discussed the conceptual framework which has guided his own investigation. The second part of the thesis presents the results of an original study of a sample of first year undergraduates in Arts and Science at Simon Fraser University. The object of the investigation was to test a number of assumptions about the social and psychological factors which influence the choice of areas of study, and the choice of occupations; and particularly to examine any significant differences in this respect between the Arts and Science students. In his conclusions the candidate makes use of the results of his general survey and of his empirical inquiry to indicate some practical implications for the future recruitment of scientists in Canada.

The thesis is distinguished by its systematic exposition and clarity of expression. In his general survey the candidate shows that he is well acquainted with the existing material on the subject and he uses it in an imaginative manner. His own empirical study is well conceived and ably carried out. It represents a useful new contribution to our understanding of the processes of recruitment of scientists. The candidate displays good critical judgement, and a sound appreciation of the directions in which this research could fruitfully be pursued further.

In a lengthy oral examination we made a number of critical observations, especially with regard to the candidate's treatment of the relation between the development of science and changes in the structure of Canadian society, which we thought should have been discussed more fully. The candidate replied adequately to these criticisms in justifying the approach which he had adopted.

The general standard of the thesis is high, and the candidate is to be commended upon completing a substantial piece of

work of this quality within the minimum period of twelve months. The thesis provides a sound basis for any further work by the candidate in the field of the sociology of science.

We recommend that the degree of Master of Arts be conferred upon the candidate.
