Description The first part of the course will focus on dynamic optimization problems, with an emphasis on dynamic programming. Applications may include growth, business cycles, monetary and fiscal policy, and optimal contracts. The second part of the course will focus on models of learning and bounded rationality. Genetic and stochastic approximation algorithms will be studied. Applications may include the stability of rational expectations equilibria, the evolution of institutions and social conventions, and models of robust control and Knightian uncertainty.	Description The graduate course teaches advanced skills for building and analyzing structural economic models with a focus on models of consumer choice in different domains. The course covers Monte Carlo simulations, optimization methods, mixture models, bootstrap, and neural nets for economic applications. Upon completion, students will be proficient in the latest computational methods and able to apply them to diverse economic problems.
